Remotes Branching Rebasing

#### Remotes

## Viewing remotes

```
% git remote -v
origin git+ssh://git@git.myremote.com/myrepo
```

## Adding remotes

On a remote machine:

git init --bare ~/myrepo.git

Then add the new remote:

git remote add myremote git+ssh://myhost/myrepo

# Mirroring a repo

```
git push --mirror myremote

or:
git push myremote \
    refs/remotes/myremote/*:refs/heads/*
```

## Remote branches

git branch -r

## Remote-tracking branches

#### Create a new branch that tracks the remote:

git checkout --track origin/somebranch

#### Or for existing branches:

git branch --set-upstream somebranch\
 origin/somebranch

#### Or for new branches:

git push -u origin mynewbranch

## Remote-tracking shorthand

```
git rev-parse --short @{upstream}
git rev-parse --short @{u}
```

## Viewing differences with upstream

```
Overview:
```

```
git status
```

### Incoming changesets:

```
git log --oneline --decorate ..@{u}
```

#### Outgoing changesets:

```
git log --oneline --decorate @{u}..
```

#### All local branches:

```
git branch -v
```

## Viewing differences in your prompt

```
wget https://raw.github.com/git/git/master/\
    contrib/completion/git-completion.bash
Add this to your ~/.bashrc:
source ~/path/to/git-completion.bash
GIT_PS1_SHOWUPSTREAM="verbose" # or "auto"
Add $(__git_ps1 " (%s)") to your PS1:
PS1='\u@\h:\W$(__git_ps1 " (%s)")\$'
```

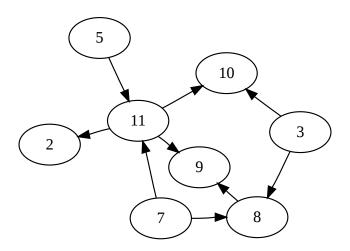

# git pull considered harmful

```
git fetch
git merge @{u}
Or:
git fetch
git rebase @{u}
```

Remotes Branching Rebasing

### Branching

## The DAG

## refs/heads

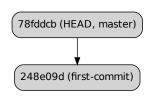

% cat .git/refs/heads/master
6bf4e7278d0cd3301ac40874d6aca6636c21975d

Remotes Branching Rebasing

### Rebasing

### commit --amend

touch A && git add A
git commit -m "Added A"
git tag first-commit
touch B && git add B
git commit -m "Added B"

git commit --amend \
 -m "Added B and stuff"

### Interactive

```
% git status -s -b
## mybranch...origin/develop [ahead 7]
% git rebase -i @{u} # or git rebase -i HEAD~7
```

## Upstream

```
git fetch
git rebase @{u}
```

### rebase --onto

git rebase --onto newbranch oldbranch branchname

### reset --soft

Moves the ref HEAD points to.

## reset [--mixed]

Moves the ref HEAD points to.

# reset [--mixed]

- Moves the ref HEAD points to.
- Updates the index to match HEAD.

### reset --hard

Moves the ref HEAD points to.

### reset --hard

- Moves the ref HEAD points to.
- Updates the index to match HEAD.

### reset --hard

- Moves the ref HEAD points to.
- Updates the index to match HEAD.
- Updates the working directory to match HEAD.

# The reflog

git reflog --date=relative

## Garbage collection

 Git garbage collects objects with no references that are older than 30 days.

## Garbage collection

- Git garbage collects objects with no references that are older than 30 days.
- The reflog counts as a reference.

## Garbage collection

- Git garbage collects objects with no references that are older than 30 days.
- The reflog counts as a reference.
  - reflog entries are pruned after 90 days.
